

My ontology describes Kat Von D's lipstick line. She does make other products, and if they were part of a package with a lipstick, I included them. However, my ontology is limited to the products/packages that include lipstick. The main class in my ontology is PRODUCT. The other classes ('PRICE MAX', 'OTHER PRODUCT', 'FINISH', and COLOUR) all connect to the products under the PRODUCT class, and describe those products. The annotations I included are: rdfs: label, definition, and reference. I used the definition field to describe the different classes and the classes below them individually, and the reference field to say where I got those definitions. Kat Von D's website provided many of the necessary definitions but some I had to go looking for or draw on personal knowledge/experience.
